Recommendations for Blood sampling In the Emergency Department

Wed 15 May 2024 | 5PM CET

A collaboration between EUSEM, European Federation of Clinical Chemistry and Laboratory Medicine (EFLM), and European Society for Emergency Nursing (EUSEN)

Don't miss this **FREE educational webinar**. Join us in exploring the benefits of prehospital blood sampling. In today's fast-paced world, every second counts, especially in critical situations where prompt medical intervention and precision.

Blood sampling is a regularly performed medical procedure that requires a high degree of precision. However, the specific details of this process have received limited attention. To address this issue, representatives from EUSEM, European Federation of Clinical Chemistry and Laboratory Medicine (EFLM), and European Society for Emergency Nursing (EUSEN) have formulated recommendations utilising evidence-based methodology to publish guidelines to prevent errors.

This webinar session will cover the following presentations and conclude with a Q&A session.

Is there any benefit in prehospital blood sampling? What are the risks of sampling from an intravenous (IV) line? Which Quality Indicator should be included on the quality control dashboard for the blood sampling procedure?

Speakers:

Dr. Christien Van Der Linden (The Netherlands)

Dr. Janne Cadamuro (Austria)

Dr. Christoph Dodt (Germany)

Moderated by Dr. Luis Garcia-Castrillo (Spain), Dr. Said Idrissi (Belgium).
